RUNNING THE SITE

How to add products, and how to start receiving the enquiries people send from the Request a Quote page.

> The short answer
>
> Enquiries are not reaching you because the form currently opens a draft in the visitor's own email program instead of sending anything. Nothing arrives unless they press send there. Connecting a small form service fixes it in about ten minutes — page 2 explains it, page 3 is the steps.

INSIDE

02 Why no email reaches you

WHY NO EMAIL REACHES YOU

Nothing is broken in the form itself. The site is a static site on GitHub Pages, and right now the Request a Quote button hands the enquiry to the *visitor's own* mail app instead of sending it.

What happens today

1. A buyer fills in the form and presses send.
2. The browser opens a pre-filled draft in **their** email program, addressed to info@ntfint.com.
3. If they have no mail program set up, or they close that draft, or they simply never press send in it, **you get nothing** — and the site cannot tell you that it happened.

This is why your own test never arrived: the draft was created, but no message was ever actually sent. A static site has no server of its own, so it cannot send mail by itself. It needs a small form service in between — that service receives the submission and emails it straight to your inbox.

THE THREE WAYS TO FIX IT

OPTION	COST	WHAT YOU GET
Form service Recommended	Free tier (about 50 enquiries a month)	The enquiry lands in your inbox within seconds, with a copy stored in the service dashboard. No server to run. One line of code to change.
Your own backend	Hosting fees	Full control, but something to host, maintain and secure for one form.
Leave it as a mail draft	Free	What happens now. Loses most enquiries. Not recommended.

> **Whichever route you take, add WhatsApp as the backup.** Your buyers in this trade reply faster there than by email, and the number is already on every page.

TURNING THE FORM INTO REAL EMAIL

About ten minutes, once. These steps use Formspree; Web3Forms and FormSubmit work the same way if you prefer one of those.

01

CREATE THE FORM ENDPOINT

Go to formspree.io, sign up with **info@ntfint.com** — the inbox you want the enquiries in — and create a new form. You are given an address that looks like this:

```
https://formspree.io/f/xxxxxxxx
```

02

CONFIRM THE INBOX

Formspree sends one confirmation email. Click the link in it. Until you do, it will not deliver anything — this is the step people usually miss.

03

POINT THE FORM AT IT

In `assets/js/main.js`, the submit handler currently ends with a line that opens a mail draft. It is replaced with a real send:

```
fetch('https://formspree.io/f/xxxxxxxx', {
  method: 'POST',
  headers: { 'Accept': 'application/json' },
  body: new FormData(form)
});
```

Send me the endpoint and I will make this change, test it and push it.

04

TEST IT PROPERLY

Open the live site, send one enquiry, and check the inbox **and** the spam folder. Mark the first message as “not spam” so the rest land normally.

> **After this is live** the visitor sees a confirmation on the page, you get the email, and every enquiry is also kept in the Formspree dashboard — so nothing is lost even if an email goes astray.

ADDING A PRODUCT

Every page on the site is generated from one file, `tools/build.py`. You add the product once there and the site builds its collection tile, its own product page, the search index and the sitemap for you.

01

ADD THE PHOTO

Put a JPEG in `assets/img/photos/`. Name it in lower case with dashes, for example `mma-ankle-guards.jpg`. Roughly 1600 px wide, under 300 KB.

02

ADD THE ENTRY

In `tools/build.py`, find the collection inside `CATEGORIES` and add one block to its `products` list:

```
P("Ankle Guards", ["Neoprene", "Pair"], "Cage-legal // Slip-on",
  ["S","M","L","XL"], 25,
  "Slip-on neoprene ankle support with a stitched arch strap.",
  [("Fabric","4 mm neoprene"),
   ("Build","Flatlock seams"),
   ("Decoration","Heat transfer or embroidery")],
  "mma-ankle-guards"),
```

The values in order: name, the two badges, the small line under the name, sizes, minimum order quantity, the description, the specification rows, and the photo file name without `.jpg`.

03

BUILD AND PUBLISH

```
python3 tools/build.py
git add -A
git commit -m "Add Ankle Guards to MMA Wear"
git push
```

The live site updates about a minute later.

> **A whole new collection** is the same job one level up: add a new block to `CATEGORIES` with its slug, name, tag, hero photo and description, then its products. The menu, the collections page and the site map all pick it up automatically.

CHECKLIST

Two lists worth keeping beside you.

TO START RECEIVING ENQUIRIES

01 Create the form endpoint with your real inbox

02 Click the confirmation email

03 Send me the endpoint so the form can be wired to it

04 Send one test enquiry from the live site

05 Check inbox and spam; mark as not spam

06 Add the inbox to your phone so nothing waits a day

EVERY TIME YOU ADD A PRODUCT

01 Photo into `assets/img/photos/`

02 One `P(...)` block in the right collection

03 Minimum order quantity set honestly

04 Three or four specification rows

05 Run `python3 tools/build.py`

06 Commit and push

07 Open the live product page and read it once

WHERE THINGS LIVE

`tools/build.py`	All text, products, collections, prices and contact details
`assets/img/photos/`	Every photograph on the site
`assets/js/main.js`	Form behaviour, theme switch, animations
`assets/css/style.css`	The whole look of the site
`docs/`	The site map PDFs and this guide

> **One rule:** never edit the built `.html` files by hand. The next build overwrites them. Change `tools/build.py` and rebuild.
